ELEMENTALS

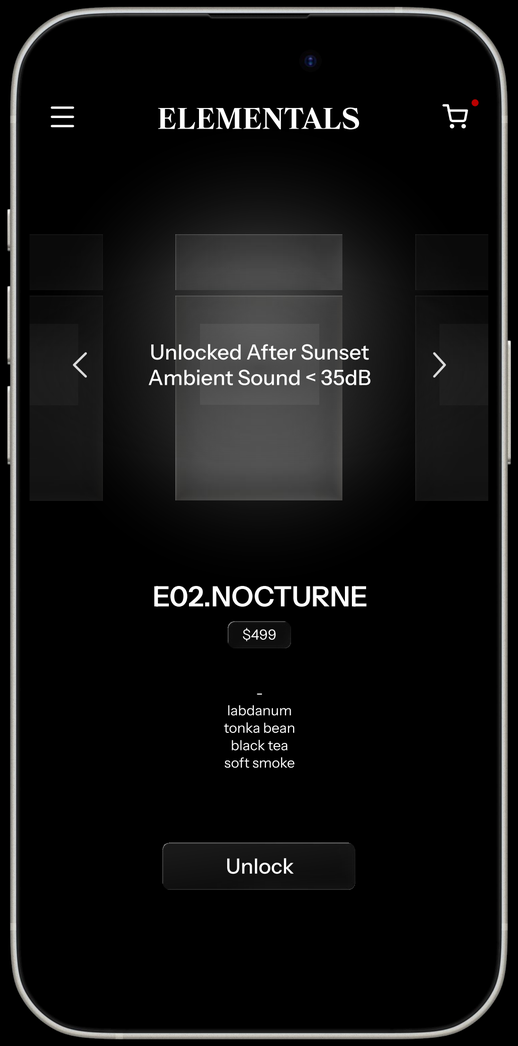

“Luxury defined by experience, not price.”

-

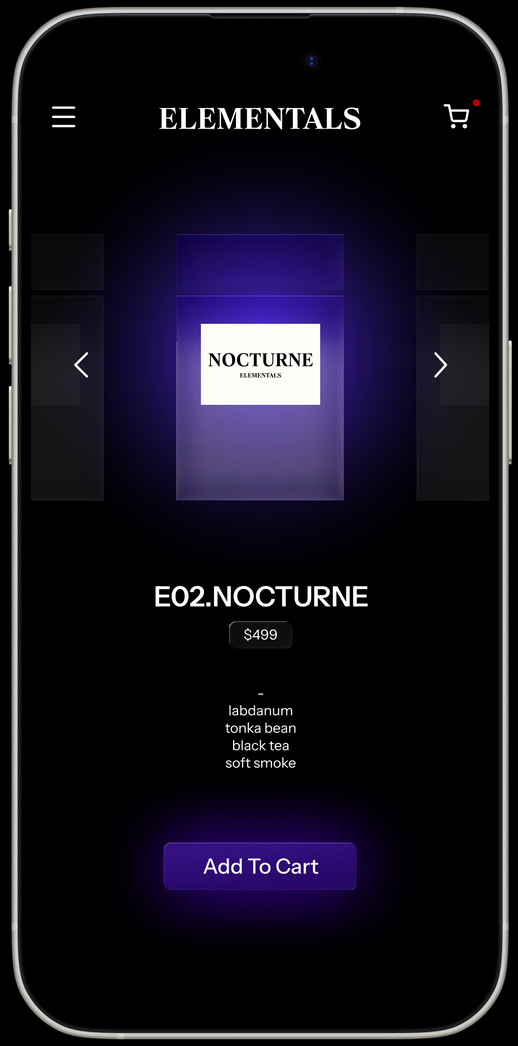

ELEMENTALS is a digital-native luxury fragrance concept where scents are unlocked through real-world environmental interactions. Through a GPS-based mobile interface, users explore a canon of fragrances tied to atmospheric conditions: standing near a river, entering a forest, or stepping outside late at night. When these moments align, the fragrance becomes available, turning scent into a personal record of place, experience, and memory.

Sustainable

ELEMENTALS is built around a **refillable** bottle system that reduces packaging waste while preserving each bottle as a long-term object. It also uses a **standardized** glass bottle design across all scents, with only the label and color changing between fragrances, minimizing manufacturing variation.

Inclusive

In ELEMENTALS, value is defined through **personal experiences** broadly accessible across the world, rather than solely price. All scents remain **gender, race, and identity-neutral**, while special editions remain distinctive through place and moment.

Scalable

ELEMENTALS scales globally through **partnerships** with national parks, tourism boards, and conservation organizations, creating location-specific Special Edition scents tied to distinct landmarks around the world. These collaborations encourage travel and exploration while enabling the platform to grow through **culturally and geographically meaningful** releases.

Feasible

The unlock system relies on **standard smartphone capabilities** such as GPS, time, and sound, making it simple to implement without additional hardware. In addition, although every user experiences a fragrance through unique moments of access, all scents remain **professionally developed** and consistently produced.

Measurable

The success of ELEMENTALS can be measured through an **Unlock-to-Purchase Conversion Rate**, defined as the percentage of users who unlock an Elemental and complete a purchase within a defined time window. This metric captures how effectively real-world discovery translates into meaningful engagement, indicating both user intent and the perceived value of the experience.
